

Chapter 1: Real Estate Schema Architecture

This chapter initiates the document flow. When building a Retrieval-Augmented Generation pipeline or a Model Context Protocol server, extracting structured text cleanly is the first requirement.

Notice that this text is part of Chapter 1. In standard PDF formatting, this is just text on a page. We rely on the PDF's internal Outline (Bookmarks) to map this text to a specific chapter heading.

Chapter 2: Tabular Rental Data

Below is a structured table containing sample schema parameters. PDF parsers must identify the grid layout to prevent text from merging horizontally.

Table Name	Column	Data Type
dxs_rentals	property_id	VARCHAR
dxs_rentals	annual_rent_aed	NUMERIC

Chapter 3: Embedded Images and OCR

The final chapter contains a rasterized image. This ensures your chunking logic can appropriately handle transitions from raw text extraction to image-based OCR workflows.

OCR Target:
Dubai Rental Listings Database

Schema ID: MCP-DXB-2026
